

CLK Diffusion Cyclone Dust Collector

CLK diffusion cyclone dust collector is suitable for supplementing dry non-fibrous granular dust. The main feature is that the barrel body is inverted cone shape, thus reducing the possibility of dust gas from the center of the barrel body to the outlet, Cone-shaped reflective screens are installed to prevent the two air streams from re-coiling the separated dust and being carried by the updraft, thus improving the dust removal efficiency.

CLK diffusion cyclone dust collector is used in the industries such as metallurgy, foundry, building materials, chemical food, cement, etc. to supplement the dry non-fibrous particulate dust and flue gas dust, and can be used as recycling material equipment.
